

The IAU has defined the term "planet" for objects orbiting the Sun in terms of gravitational properties: massive enough for gravity to force it into a spheroidal shape, and to be the dominant gravitational object in its orbit. An exoplanet is a planet that orbits another star (i.e., not the Sun).

Question: The number of known Exoplanets is 9224.

- a) ☐ True
- b) ☐ False.
- c) Write in (If you answered false)

The IAU has defined the term "planet" for objects orbiting the Sun in terms of gravitational properties: massive enough for gravity to force it into a spheroidal shape, and to be the dominant gravitational object in its orbit. An exoplanet is a planet that orbits another star (i.e., not the Sun).

Question: The number of known Exoplanets is 9224.

- d) ☐ True
- e) ☐ False.
- f) Write in (If you answered false)

The IAU has defined the term "planet" for objects orbiting the Sun in terms of gravitational properties: massive enough for gravity to force it into a spheroidal shape, and to be the dominant gravitational object in its orbit. An exoplanet is a planet that orbits another star (i.e., not the Sun).

Question: The number of known Exoplanets is 1834.

- g) ☐ True
- h) ☐ False.
- i) Write in (If you answered false)

The IAU has defined the term "planet" for objects orbiting the Sun in terms of gravitational properties: massive enough for gravity to force it into a spheroidal shape, and to be the dominant gravitational object in its orbit. An exoplanet is a planet that orbits another star (i.e., not the Sun).

Question: The number of known Exoplanets is 1834.

- j) ☐ True
- k) ☐ False.
- l) Write in (If you answered false)
